# **cloudify-plugins-common**

## **Documentation**

***Release 3.3***

**Gigaspaces**

December 16, 2015

<b>1</b>	<b>Context</b>	<b>3</b>
<b>2</b>	<b>Decorators</b>	<b>9</b>
<b>3</b>	<b>Exceptions</b>	<b>11</b>
<b>4</b>	<b>Manager</b>	<b>13</b>
<b>5</b>	<b>Mocks</b>	<b>15</b>
<b>6</b>	<b>Utils</b>	<b>17</b>
<b>7</b>	<b>Logs</b>	<b>19</b>
<b>8</b>	<b>Workflows</b>	<b>23</b>
8.1	Workflow Tasks Graph . . . . .	23
8.2	Workflow API . . . . .	25
8.3	Workflow Context . . . . .	25
<b>9</b>	<b>Indices and tables</b>	<b>33</b>
	<b>Python Module Index</b>	<b>35</b>

This is the API reference to the cloudify-plugins-common module which is required when writing any cloudify plugin (and workflow).

Contents:

---

## Context

---

```

class cloudify.context.ContextCapabilities (endpoint, instance)
    Bases: object
        Maps from instance relationship target ids to their respective runtime properties
    get_all()
        Returns all capabilities as dict.

class cloudify.context.CommonContext (ctx=None)
    Bases: object

class cloudify.context.BootstrapContext (bootstrap_context)
    Bases: object
        Holds bootstrap context that was posted to the rest service. (usually during the bootstrap process).

class PolicyEngine (policy_engine)
    Bases: object
        Cloudify policy engine related configuration
    start_timeout
        Returns the number of seconds to wait for the policy engine to start

class BootstrapContext.CloudifyAgent (cloudify_agent)
    Bases: object
        Cloudify agent related bootstrap context properties.
    min_workers
        Returns the minimum number of workers for agent hosts.
    max_workers
        Returns the maximum number of workers for agent hosts.
    user
        Returns the username used when SSH-ing during agent installation.
    remote_execution_port
        Returns the port used when SSH-ing during agent installation.
    agent_key_path
        Returns the path to the key file on the management machine used when SSH-ing during agent installation.
    broker_ip
        Returns the IP for connecting to rabbit. An empty string should result in clients using the manager IP.

```

---

```
broker_user
    Returns the username for connecting to rabbit.

broker_pass
    Returns the password for connecting to rabbit.

broker_ssl_enabled
    Returns whether SSL is enabled for connecting to rabbit.

broker_ssl_cert
    Returns the SSL public cert for connecting to rabbit.

BootstrapContext.cloudify_agent
    Returns Cloudify agent related bootstrap context data

Return type CloudifyAgent

BootstrapContext.policy_engine
    Returns Cloudify policy engine related bootstrap context data

Return type PolicyEngine

BootstrapContext.resources_prefix
    Returns the resources prefix that was configured during bootstrap. An empty string is returned if the resources prefix was not configured.

class cloudify.context.EntityContext(context, **_)
    Bases: object

class cloudify.context.BlueprintContext(context, **_)
    Bases: cloudify.context.EntityContext

    id
        The blueprint id the plugin invocation belongs to.

class cloudify.context.DeploymentContext(context, **_)
    Bases: cloudify.context.EntityContext

    id
        The deployment id the plugin invocation belongs to.

class cloudify.context.NodeContext(*args, **kwargs)
    Bases: cloudify.context.EntityContext

    id
        The node's id

    name
        The node's name

    properties
        The node properties as dict (read-only). These properties are the properties specified in the blueprint.

    type
        The node's type

    type_hierarchy
        The node's type hierarchy

class cloudify.context.NodeInstanceContext(*args, **kwargs)
    Bases: cloudify.context.EntityContext

    id
        The node instance id.
```

**runtime\_properties**

The node instance runtime properties as a dict (read-only).

Runtime properties are properties set during the node instance's lifecycle. Retrieving runtime properties involves a call to Cloudify's storage.

**update()**

Stores new/updated runtime properties for the node instance in context in Cloudify's storage.

This method should be invoked only if its necessary to immediately update Cloudify's storage with changes. Otherwise, the method is automatically invoked as soon as the task execution is over.

**host\_ip**

Returns the node instance host ip address.

This values is derived by reading the `host_id` from the relevant node instance and then reading its `ip` runtime property or its `node_state.ip` property.

**relationships**

Returns a list of this instance relationships

**Returns** list of RelationshipContext

**Return type** list

**class** `cloudify.context.RelationshipContext` (*relationship\_context, endpoint, node*)

Bases: `cloudify.context.EntityContext`

Holds relationship instance data

**target**

Returns a holder for target node and target instance

**Return type** `RelationshipSubjectContext`

**type**

The relationship type

**type\_hierarchy**

The relationship type hierarchy

**class** `cloudify.context.RelationshipSubjectContext` (*context, endpoint, modifiable*)

Bases: `object`

Holds reference to node and node instance.

Obtained in relationship operations by `ctx.source` and `ctx.target`, and by iterating instance relationships and for each relationship, reading `relationship.target`

**class** `cloudify.context.CloudifyContext` (*ctx=None*)

Bases: `cloudify.context.CommonContext`

A context object passed to plugins tasks invocations. The context object is used in plugins when interacting with the Cloudify environment:

```
from cloudify import ctx

@operation
def my_start(**kwargs):
    # port is a property that was configured on the current instance's
    # node
    port = ctx.node.properties['port']
    start_server(port=port)
```

**instance**

The node instance the operation is executed for.

This property is only relevant for NODE\_INSTANCE context operations.

**node**

The node the operation is executed for.

This property is only relevant for NODE\_INSTANCE context operations.

**source**

Provides access to the relationship's operation source node and node instance.

This property is only relevant for relationship operations.

**target**

Provides access to the relationship's operation target node and node instance.

This property is only relevant for relationship operations.

**type**

The type of this context.

Available values:

- DEPLOYMENT
- NODE\_INSTANCE
- RELATIONSHIP\_INSTANCE

**execution\_id**

The workflow execution id the plugin invocation was requested from. This is a unique value which identifies a specific workflow execution.

**workflow\_id**

The workflow id the plugin invocation was requested from. For example:

install, uninstall etc...

**task\_id**

The plugin's task invocation unique id.

**task\_name**

The full task name of the invoked task.

**task\_target**

The task target (celery worker name).

**task\_queue**

The task target (celery queue name).

**plugin**

The plugin name of the invoked task.

**operation**

The current operation context.

**agent**

**capabilities**

Maps from instance relationship target ids to their respective runtime properties

NOTE: This feature is deprecated, use 'instance.relationships' instead.

**logger**

A Cloudify context aware logger.

Use this logger in order to index logged messages in ElasticSearch using logstash.

**bootstrap\_context**

System context provided during the bootstrap process

**Return type** *BootstrapContext*

**send\_event (event)**

Send an event to rabbitmq

**Parameters** **event** – the event message

**provider\_context**

Gets provider context which contains provider specific metadata.

**get\_resource (resource\_path)**

Retrieves a resource bundled with the blueprint as a string.

**Parameters** **resource\_path** – the path to the resource. Note that this path is relative to the blueprint file which was uploaded.

**get\_resource\_and\_render (resource\_path, template\_variables=None)**

Like get\_resource, but also renders the resource according to template\_variables. This context is added to template\_variables.

**Parameters** **template\_variables** – according to this dict the resource will be rendered.

**download\_resource (resource\_path, target\_path=None)**

Retrieves a resource bundled with the blueprint and saves it under a local file.

**Parameters**

- **resource\_path** – the path to the resource. Note that this path is relative to the blueprint file which was uploaded.
- **target\_path** – optional local path (including filename) to store the resource at on the local file system. If missing, the location will be a tempfile with a generated name.

**Returns**

The path to the resource on the local file system (identical to target\_path parameter if used).

raises an `cloudify.exceptions.HttpException`

**Raises** `cloudify.exceptions.HttpException` on any kind of HTTP Error.

**Raises** `IOError` if the resource failed to be written to the local file system.

**download\_resource\_and\_render (resource\_path, target\_path=None, template\_variables=None)**

Like download\_resource, but also renders the resource according to template\_variables. This context is added to template\_variables.

**Parameters** **template\_variables** – according to this dict the resource will be rendered.

**class cloudify.context.OperationContext (operation\_context)**

Bases: object

**name**

The name of the operation.

**retry\_number**

The retry number (relevant for retries and recoverable errors).

**max\_retries**

The maximum number of retries the operation can have.

**retry** (*message=None, retry\_after=None*)

Specifies that this operation should be retried.

**Usage:** return ctx.operation.retry(message='...', retry\_after=1000)

**:param message** A text message containing information about the reason for retrying the operation.

**:param retry\_after** How many seconds should the workflow engine wait before re-executing the operation.

```
class cloudify.context.CloudifyAgentContext(context)
```

Bases: object

```
init_script(agent_config=None)
```

---

## Decorators

---

`cloudify.decorators.operation(func=None, **arguments)`

Decorate plugin operation function with this decorator. Internally, if celery is installed, will also wrap the function with a `@celery.task` decorator

The `ctx` injected to the function arguments is of type `cloudify.context.CloudifyContext`

The `ctx` object can also be accessed by importing `cloudify.ctx`

Example:

```
from cloudify import ctx

@operations
def start(**kwargs):
    pass
```

`cloudify.decorators.workflow(func=None, system_wide=False, **arguments)`

Decorate workflow functions with this decorator. Internally, if celery is installed, `@workflow` will also wrap the function with a `@celery.task` decorator

The `ctx` injected to the function arguments is of type `cloudify.workflows.workflow_context.CloudifyWorkflowContext` or `cloudify.workflows.workflow_context.CloudifySystemWideWorkflowContext` if `system_wide` flag is set to True.

The `ctx` object can also be accessed by importing `cloudify.workflows.ctx`

`system_wide` flag turns this workflow into a system-wide workflow that is executed by the management worker and has access to an instance of `cloudify.workflows.workflow_context.CloudifySystemWideWorkflowContext` as its context.

Example:

```
from cloudify.workflows import ctx

@workflow
def reinstall(**kwargs):
    pass
```

`exception cloudify.decorators.RequestSystemExit`

Bases: `exceptions.SystemExit`

---

## Exceptions

---

**exception** `cloudify.exceptions.NonRecoverableError`

Bases: `exceptions.Exception`

An error raised by plugins to denote that no retry should be attempted by the executing workflow engine.

**exception** `cloudify.exceptions.RecoverableError(message=None, retry_after=None)`

Bases: `exceptions.Exception`

An error raised by plugins to explicitly denote that this is a recoverable error (note that this is the default behavior). It is possible specifying how many seconds should pass before a retry is attempted thus overriding the bootstrap context configuration parameter: `cloudify.workflows.retry_interval`

**Parameters** `retry_after` – How many seconds should the workflow engine wait before re-executing the task that raised this exception. (only applies when the workflow engine decides that this task should be retried)

**exception** `cloudify.exceptions.OperationRetry(message=None, retry_after=None)`

Bases: `cloudify.exceptions.RecoverableError`

An error raised internally when an operation uses the `ctx.operation.retry` API for specifying that an operation should be retried.

**exception** `cloudify.exceptions.HttpException(url, code, message)`

Bases: `cloudify.exceptions.NonRecoverableError`

Wraps HTTP based exceptions that may be raised.

**Parameters**

- `url` – The url the request was made to.
- `code` – The response status code.
- `message` – The underlying reason for the error.

**exception** `cloudify.exceptions.CommandExecutionError(command, error=None)`

Bases: `exceptions.RuntimeError`

Indicates a command failed to execute. note that this is different than the `CommandExecutionException` in that in this case, the command execution did not even start, and therefore there is not return code or stdout output.

**Parameters**

- `command` – The command executed
- `error` – the error preventing the command from executing

**exception** `cloudify.exceptions.CommandExecutionException(command, error, output, code)`

Bases: `exceptions.Exception`

Indicates a command was executed, however some sort of error happened, resulting in a non-zero return value of the process.

#### Parameters

- **command** – The command executed
- **code** – process exit code
- **error** – process stderr output
- **output** – process stdout output

**exception** `cloudify.exceptions.TimeoutException(*args)`

Bases: `exceptions.Exception`

Indicates some kind of timeout happened.

**exception** `cloudify.exceptions.ProcessExecutionError(message, error_type=None, trace-back=None)`

Bases: `exceptions.RuntimeError`

Raised by the workflow engine when workflow execution fails.

---

## Manager

---

```
class cloudify.manager.NodeInstance(node_instance_id, node_id, runtime_properties=None,
                                     state=None, version=None, host_id=None, relationships=None)
```

Bases: object

Represents a deployment node instance. An instance of this class contains runtime information retrieved from Cloudify's runtime storage as well as the node's state.

**delete** (key)

**runtime\_properties**

The node instance runtime properties.

To update the properties, make changes on the returned dict and call `update_node_instance` with the modified instance.

**state**

The node instance state.

To update the node instance state, change this property value and call `update_node_instance` with the modified instance.

**node\_id**

**relationships**

```
cloudify.manager.get_rest_client()
```

**Returns** A REST client configured to connect to the manager in context

**Return type** `cloudify_rest_client.CloudifyClient`

```
cloudify.manager.download_resource(resource_path, logger, target_path=None)
```

Download resource from the manager file server.

**Parameters**

- **resource\_path** – path to resource on the file server
- **logger** – logger to use for info output
- **target\_path** – optional target path for the resource

**Returns** path to the downloaded resource

```
cloudify.manager.download_blueprint_resource(blueprint_id, resource_path, logger, target_path=None)
```

Download resource from the manager file server with path relative to the blueprint denoted by `blueprint_id`.

### Parameters

- **blueprint\_id** – the blueprint id of the blueprint to download the resource from
- **resource\_path** – path to resource relative to blueprint folder
- **logger** – logger to use for info output
- **target\_path** – optional target path for the resource

**Returns** path to the downloaded resource

`cloudify.manager.get_resource(resource_path, base_url=None)`

Get resource from the manager file server.

**Parameters** **resource\_path** – path to resource on the file server

**Returns** resource content

`cloudify.manager.get_blueprint_resource(blueprint_id, resource_path)`

Get resource from the manager file server with patch relative to the blueprint denoted by `blueprint_id`.

### Parameters

- **blueprint\_id** – the blueprint id of the blueprint to download the resource from
- **resource\_path** – path to resource relative to blueprint folder

**Returns** resource content

`cloudify.manager.get_node_instance(node_instance_id)`

Read node instance data from the storage.

**Parameters** **node\_instance\_id** – the node instance id

**Return type** `NodeInstance`

`cloudify.manager.update_node_instance(node_instance)`

Update node instance data changes in the storage.

**Parameters** **node\_instance** – the node instance with the updated data

`cloudify.manager.get_node_instance_ip(node_instance_id)`

Get the IP address of the host the node instance denoted by `node_instance_id` is contained in.

`cloudify.manager.update_execution_status(execution_id, status, error=None)`

Update the execution status of the execution denoted by `execution_id`.

**Returns** The updated status

`cloudify.manager.get_bootstrap_context()`

Read the manager bootstrap context.

`cloudify.manager.get_provider_context()`

Read the manager provider context.

---

## Mocks

---

```
class cloudify.mocks.MockNodeInstanceContext (id=None, runtime_properties=None)
    Bases: object

    id
    runtime_properties
    update()

class cloudify.mocks.MockNodeContext (id=None, properties=None)
    Bases: object

    id
    name
    properties

class cloudify.mocks.MockContext (values=None)
    Bases: dict

class cloudify.mocks.MockCloudifyContext (node_id=None, node_name=None,
                                         blueprint_id=None, deployment_id=None,
                                         execution_id=None, properties=None,
                                         runtime_properties=None, capabilities=None,
                                         related=None, source=None, target=None,
                                         operation=None, resources=None,
                                         provider_context=None, bootstrap_context=None)
    Bases: cloudify.context.CloudifyContext

    Cloudify context mock that can be used when testing Cloudify plugins.

    execution_id
    capabilities
    logger
    provider_context
    bootstrap_context
    download_resource (resource_path, target_path=None)
    get_resource (resource_path)
```

---

## Utils

---

`cloudify.utils.get_manager_ip()`

Returns the IP address of manager inside the management network.

`cloudify.utils.get_manager_file_server_blueprints_root_url()`

Returns the blueprints root url in the file server.

`cloudify.utils.get_manager_file_server_url()`

Returns the manager file server base url.

`cloudify.utils.get_manager_rest_service_port()`

Returns the port the manager REST service is running on.

`cloudify.utils.id_generator(size=6, chars='ABCDEFGHIJKLMNOPQRSTUVWXYZ0123456789')`

Generate and return a random string using upper case letters and digits.

`class cloudify.utils.LocalCommandRunner(logger=None, host='localhost')`

Bases: object

`run(command, exit_on_failure=True, stdout_pipe=True, stderr_pipe=True, cwd=None, execution_env=None)`

Runs local commands.

### Parameters

- **command** – The command to execute.
- **exit\_on\_failure** – False to ignore failures.
- **stdout\_pipe** – False to not pipe the standard output.
- **stderr\_pipe** – False to not pipe the standard error.
- **cwd** – the working directory the command will run from.
- **execution\_env** – dictionary of environment variables that will be present in the command scope.

**Returns** A wrapper object for all valuable info from the execution.

**Return type** `cloudify.utils.CommandExecutionResponse`

`class cloudify.utils.CommandExecutionResponse(command, std_out, std_err, return_code)`

Bases: object

Wrapper object for info returned when running commands.

### Parameters

- **command** – The command that was executed.

- **std\_out** – The output from the execution.
- **std\_err** – The error message from the execution.
- **return\_code** – The return code from the execution.

```
cloudify.utils.setup_default_logger(logger_name, logger_level=20, handlers=None, remove_existing_handlers=True, logger_format=None, propagate=True)
```

**Parameters**

- **logger\_name** – Name of the logger.
- **logger\_level** – Level for the logger (not for specific handler).
- **handlers** – An optional list of handlers (formatter will be overridden); If None, only a StreamHandler for sys.stdout will be used.
- **remove\_existing\_handlers** – Determines whether to remove existing handlers before adding new ones
- **logger\_format** – the format this logger will have.
- **propagate** – propagate the message the parent logger.

**Returns** A logger instance.

**Return type** logging.Logger

```
class cloudify.utils.Internal
    Bases: object

    static get_install_method(properties)
    static get_broker_ssl_and_port(ssl_enabled, cert_path)
    static get_broker_credentials(cloudify_agent)
        Get broker credentials or their defaults if not set.
```

---

## Logs

---

```
cloudify.logs.message_context_from_cloudify_context(ctx)
    Build a message context from a CloudifyContext instance

cloudify.logs.message_context_from_workflow_context(ctx)
    Build a message context from a CloudifyWorkflowContext instance

cloudify.logs.message_context_from_sys_wide_wf_context(ctx)
    Build a message context from a CloudifyWorkflowContext instance

cloudify.logs.message_context_from_workflow_node_instance_context(ctx)
    Build a message context from a CloudifyWorkflowNode instance

class cloudify.logs.CloudifyBaseLoggingHandler(ctx, out_func, message_context_builder)
    Bases: logging.Handler

    A base handler class for writing log messages to RabbitMQ

    flush()
    emit(record)

class cloudify.logs.CloudifyPluginLoggingHandler(ctx, out_func=None)
    Bases: cloudify.logs.CloudifyBaseLoggingHandler

    A handler class for writing plugin log messages to RabbitMQ

class cloudify.logs.CloudifyWorkflowLoggingHandler(ctx, out_func=None)
    Bases: cloudify.logs.CloudifyBaseLoggingHandler

    A Handler class for writing workflow log messages to RabbitMQ

class cloudify.logs.SystemWideWorkflowLoggingHandler(ctx, out_func=None)
    Bases: cloudify.logs.CloudifyBaseLoggingHandler

    Class for writing system-wide workflow log messages to RabbitMQ

class cloudify.logs.CloudifyWorkflowNodeLoggingHandler(ctx, out_func=None)
    Bases: cloudify.logs.CloudifyBaseLoggingHandler

    A Handler class for writing workflow nodes log messages to RabbitMQ

cloudify.logs.init_cloudify_logger(handler, logger_name, logging_level=20)
    Instantiate an amqp backed logger based on the provided handler for sending log messages to RabbitMQ
```

### Parameters

- **handler** – A logger handler based on the context
- **logger\_name** – The logger name

- **logging\_level** – The logging level

**Returns** An amqp backed logger

`cloudify.logs.send_workflow_event(ctx, event_type, message=None, args=None, additional_context=None, out_func=None)`

Send a workflow event to RabbitMQ

#### Parameters

- **ctx** – A CloudifyWorkflowContext instance
- **event\_type** – The event type
- **message** – The message
- **args** – additional arguments that may be added to the message
- **additional\_context** – additional context to be added to the context

`cloudify.logs.send_sys_wide_wf_event(ctx, event_type, message=None, args=None, additional_context=None, out_func=None)`

Send a workflow event to RabbitMQ

#### Parameters

- **ctx** – A CloudifySystemWideWorkflowContext instance
- **event\_type** – The event type
- **message** – The message
- **args** – additional arguments that may be added to the message
- **additional\_context** – additional context to be added to the context

`cloudify.logs.send_workflow_node_event(ctx, event_type, message=None, args=None, additional_context=None, out_func=None)`

Send a workflow node event to RabbitMQ

#### Parameters

- **ctx** – A CloudifyWorkflowNode instance
- **event\_type** – The event type
- **message** – The message
- **args** – additional arguments that may be added to the message
- **additional\_context** – additional context to be added to the context

`cloudify.logs.send_plugin_event(ctx, message=None, args=None, additional_context=None, out_func=None)`

Send a plugin event to RabbitMQ

#### Parameters

- **ctx** – A CloudifyContext instance
- **message** – The message
- **args** – additional arguments that may be added to the message
- **additional\_context** – additional context to be added to the context

`cloudify.logs.send_task_event(cloudify_context, event_type, message=None, args=None, additional_context=None, out_func=None)`

Send a task event to RabbitMQ

## Parameters

- **cloudify\_context** – a \_\_cloudify\_context struct as passed to operations
- **event\_type** – The event type
- **message** – The message
- **args** – additional arguments that may be added to the message
- **additional\_context** – additional context to be added to the context

```
cloudify.logs.populate_base_item(item, message_type)
```

```
cloudify.logs.amqp_event_out(event, ctx)
```

```
cloudify.logs.amqp_log_out(log, ctx)
```

```
cloudify.logs.stdout_event_out(event, ctx=None)
```

```
cloudify.logs.stdout_log_out(log, ctx=None)
```

```
cloudify.logs.create_event_message_prefix(event)
```

---

## Workflows

---

### 8.1 Workflow Tasks Graph

```
class cloudfy.workflows.tasks_graph.TaskDependencyGraph (workflow_context,      de-
                                                               fault_subgraph_task_config=None)
Bases: object

A task graph builder

Parameters workflow_context – A WorkflowContext instance (used for logging)

add_task (task)
Add a WorkflowTask to this graph

Parameters task – The task

get_task (task_id)
Get a task instance that was inserted to this graph by its id

Parameters task_id – the task id

Returns a WorkflowTask instance for the requested task if found. None, otherwise.

remove_task (task)
Remove the provided task from the graph

Parameters task – The task

add_dependency (src_task, dst_task)
Add a dependency between tasks. The source task will only be executed after the target task terminates.
A task may depend on several tasks, in which case it will only be executed after all its ‘destination’ tasks
terminate

Parameters

    • src_task – The source task
    • dst_task – The target task

sequence ()
Returns a new TaskSequence for this graph

subgraph (name)

execute ()
Start executing the graph based on tasks and dependencies between them. Calling this method will block
until one of the following occurs:
```

- 1.all tasks terminated
- 2.a task failed
- 3.an unhandled exception is raised
- 4.the execution is cancelled

Note: This method will raise an `api.ExecutionCancelled` error if the execution has been cancelled. When catching errors raised from this method, make sure to re-raise the error if it's `api.ExecutionsCancelled` in order to allow the execution to be set in cancelled mode properly.

Also note that for the time being, if such a cancelling event occurs, the method might return even while there's some operations still being executed.

**tasks\_iter()**

An iterator on tasks added to the graph

**class** `cloudify.workflows.tasks_graph.forkjoin(*tasks)`

Bases: `object`

A simple wrapper for tasks. Used in conjunction with `TaskSequence`. Defined to make the code easier to read (instead of passing a list) see `TaskSequence.add` for more details

**class** `cloudify.workflows.tasks_graph.TaskSequence(graph)`

Bases: `object`

Helper class to add tasks in a sequential manner to a task dependency graph

**Parameters** `graph` – The TaskDependencyGraph instance

**add(\*tasks)**

Add tasks to the sequence.

**Parameters** `tasks` – Each task might be:

- A WorkflowTask instance, in which case, it will be added to the graph with a dependency between it and the task previously inserted into the sequence
- A forkjoin of tasks, in which case it will be treated as a “fork-join” task in the sequence, i.e. all the fork-join tasks will depend on the last task in the sequence (could be fork join) and the next added task will depend on all tasks in this fork-join task

**class** `cloudify.workflows.tasks_graph.SubgraphTask(name, graph, task_id=None, info=None, on_success=None, on_failure=None, to_task_retries=0, retry_interval=30, send_task_events=True)`

Bases: `cloudify.workflows.tasks.WorkflowTask`

**cloudify\_context**

**is\_local()**

**name**

**sequence()**

**subgraph(name)**

**add\_task(task)**

**add\_dependency(src\_task, dst\_task)**

**apply\_async()**

**task\_terminated(task, new\_task=None)**

## 8.2 Workflow API

`cloudify.workflows.workflow_api.has_cancel_request()`

Checks for requests to cancel the workflow execution. This should be used to allow graceful termination of workflow executions.

If this method is not used and acted upon, a simple ‘cancel’ request for the execution will have no effect - ‘force-cancel’ will have to be used to abruptly terminate the execution instead.

Note: When this method returns True, the workflow should make the appropriate cleanups and then it must raise an ExecutionCancelled error if the execution indeed gets cancelled (i.e. if it’s too late to cancel there is no need to raise this exception and the workflow should end normally).

**Returns** whether there was a request to cancel the workflow execution

**exception** `cloudify.workflows.workflow_api.ExecutionCancelled`

Bases: `exceptions.Exception`

This exception should be raised when a workflow has been cancelled, once appropriate cleanups have taken place.

## 8.3 Workflow Context

```
class cloudify.workflows.workflow_context.CloudifyWorkflowRelationshipInstance(ctx,
                                                                           node_instance,
                                                                           nodes_and_instances,
                                                                           relationship_instance)
```

Bases: `object`

A node instance relationship instance

### Parameters

- `ctx` – a CloudifyWorkflowContext instance
- `node_instance` – a CloudifyWorkflowNodeInstance instance
- `nodes_and_instances` – a WorkflowNodesAndInstancesContainer instance
- `relationship_instance` – A relationship dict from a NodeInstance instance (of the rest client model)

### `target_id`

The relationship target node id

### `target_node_instance`

The relationship’s target node CloudifyWorkflowNodeInstance instance

### `relationship`

The relationship object for this relationship instance

`execute_source_operation(operation, kwargs=None, allow_kwargs_override=False,`  
 `send_task_events=True)`

Execute a node relationship source operation

### Parameters

- `operation` – The node relationship operation

- **kwargs** – optional kwargs to be passed to the called operation

```
execute_target_operation(operation,      kwargs=None,      allow_kwargs_override=False,
                        send_task_events=True)
Execute a node relationship target operation
```

#### Parameters

- **operation** – The node relationship operation
- **kwargs** – optional kwargs to be passed to the called operation

```
class cloudify.workflows.workflow_context.CloudifyWorkflowRelationship(ctx,
                           node,
                           nodes_and_instances,
                           relationship)
```

Bases: object

A node relationship

#### Parameters

- **ctx** – a CloudifyWorkflowContext instance
- **node** – a CloudifyWorkflowNode instance
- **nodes\_and\_instances** – a WorkflowNodesAndInstancesContainer instance
- **relationship** – a relationship dict from a Node instance (of the rest client mode)

#### target\_id

The relationship target node id

#### target\_node

The relationship target node WorkflowContextNode instance

#### source\_operations

The relationship source operations

#### target\_operations

The relationship target operations

#### is\_derived\_from(other\_relationship)

Parameters **other\_relationship** – a string like cloudify.relationships.contained\_in

```
class cloudify.workflows.workflow_context.CloudifyWorkflowNodeInstance(ctx,
                           node,
                           node_instance,
                           nodes_and_instances)
```

Bases: object

A plan node instance

#### Parameters

- **ctx** – a CloudifyWorkflowContext instance
- **node** – a CloudifyWorkflowContextNode instance
- **node\_instance** – a NodeInstance (rest client response model)
- **nodes\_and\_instances** – a WorkflowNodesAndInstancesContainer instance

**set\_state** (*state*)

Set the node state

**Parameters** **state** – The node state

**Returns** the state set

**get\_state** ()

Get the node state

**Returns** The node state

**send\_event** (*event*, *additional\_context=None*)

Sends a workflow node event to RabbitMQ

**Parameters**

- **event** – The event

- **additional\_context** – additional context to be added to the context

**execute\_operation** (*operation*, *kwargs=None*, *allow\_kwargs\_override=False*,

*send\_task\_events=True*)

Execute a node operation

**Parameters**

- **operation** – The node operation

- **kwargs** – optional kwargs to be passed to the called operation

**id**

The node instance id

**node\_id**

The node id (this instance is an instance of that node)

**relationships**

The node relationships

**node**

The node object for this node instance

**modification**

Modification enum (None, added, removed)

**logger**

A logger for this workflow node

**contained\_instances**

Returns node instances directly contained in this instance (children)

**get\_contained\_subgraph** ()

Returns a set containing this instance and all nodes that are contained directly and transitively within it

**class** `cloudify.workflows.workflow_context.CloudifyWorkflowNode` (*ctx*, *node*,

*nodes\_and\_instances*)

Bases: `object`

A plan node instance

**Parameters**

- **ctx** – a CloudifyWorkflowContext instance

- **node** – a Node instance (rest client response model)

- **nodes\_and\_instances** – a WorkflowNodesAndInstancesContainer instance

**id**  
The node id

**type**  
The node type

**type\_hierarchy**  
The node type hierarchy

**properties**  
The node properties

**plugins\_to\_install**  
The plugins to install in this node. (Only relevant for host nodes)

**host\_id**

**host\_node**

**number\_of\_instances**

**relationships**  
The node relationships

**operations**  
The node operations

**instances**  
The node instances

**get\_relationship(target\_id)**  
Get a node relationship by its target id

**class** `cloudify.workflows.workflow_context.WorkflowNodesAndInstancesContainer`(*workflow\_context*,  
*raw\_nodes*,  
*raw\_node\_instances*)

Bases: object

**nodes**

**node\_instances**

**get\_node(node\_id)**  
Get a node by its id

**Parameters** `node_id` – The node id

**Returns** a CloudifyWorkflowNode instance for the node or None if not found

**get\_node\_instance(node\_instance\_id)**  
Get a node instance by its id

**Parameters** `node_instance_id` – The node instance id

**Returns** a CloudifyWorkflowNode instance for the node or None if not found

**class** `cloudify.workflows.workflow_context.CloudifyWorkflowContext`(*ctx*)

Bases: `cloudify.workflows.workflow_context._WorkflowContextBase`,  
`cloudify.workflows.workflow_context.WorkflowNodesAndInstancesContainer`

A context used in workflow operations

**Parameters** `ctx` – a cloudify\_context workflow dict

```
class cloudify.workflows.workflow_context.CloudifySystemWideWorkflowContext (ctx)
Bases: cloudify.workflows.workflow_context._WorkflowContextBase
```

An instance of this class gets passed as the ctx parameter to a workflow method decorated with @workflow(system\_wide=True). This context is not particularly bound to any specific deployment. It provides a deployments\_contexts property, which is a lazily loaded dictionary, whose keys are deployment ids and values are lazily loaded (thanks to proxy\_tools.proxy) deployment contexts corresponding to those deployments. For example, in order to make use of any functionality provided by the CloudifyWorkflowContext class for a deployment “dep1”, the code should look like this:

Example:

```
with ctx.deployments_contexts['dep1'] as dep:
    for node_instance in dep.node_instances:
        pass
```

#### deployments\_contexts

```
class cloudify.workflows.workflow_context.LocalTasksProcessing (thread_pool_size=1)
Bases: object
```

**start**()

**stop**()

**add\_task**(task)

```
class cloudify.workflows.workflow_context.CloudifyWorkflowContextHandler (workflow_ctx)
Bases: object
```

**get\_context\_logging\_handler**()

**get\_node\_logging\_handler**(workflow\_node\_instance)

**bootstrap\_context**

**get\_send\_task\_event\_func**(task)

**get\_update\_execution\_status\_task**(new\_status)

**get\_send\_node\_event\_task**(workflow\_node\_instance, event, additional\_context=None)

**get\_send\_workflow\_event\_task**(event, event\_type, args, additional\_context=None)

**get\_task**(workflow\_task, queue=None, target=None)

**operation\_cloudify\_context**

**get\_set\_state\_task**(workflow\_node\_instance, state)

**get\_get\_state\_task**(workflow\_node\_instance)

**send\_workflow\_event**(event\_type, message=None, args=None, additional\_context=None)

**download\_blueprint\_resource**(resource\_path, target\_path=None)

**start\_deployment\_modification**(nodes)

**finish\_deployment\_modification**(modification)

**rollback\_deployment\_modification**(modification)

```
class cloudify.workflows.workflow_context.RemoteContextHandler (workflow_ctx)
```

Bases: *cloudify.workflows.workflow\_context.CloudifyWorkflowContextHandler*

**bootstrap\_context**

**get\_send\_task\_event\_func**(task)

```
get_update_execution_status_task(new_status)
get_send_workflow_event_task(event, event_type, args, additional_context=None)
get_task(workflow_task, queue=None, target=None)
operation_cloudify_context
get_set_state_task(workflow_node_instance, state)
get_get_state_task(workflow_node_instance)
download_blueprint_resource(blueprint_id, resource_path, target_path=None)

class cloudify.workflows.workflow_context.RemoteCloudifyWorkflowContextHandler(workflow_ctx)
    Bases: cloudify.workflows.workflow_context.RemoteContextHandler

        get_node_logging_handler(workflow_node_instance)
        get_context_logging_handler()
        download_blueprint_resource(resource_path, target_path=None)
        start_deployment_modification(nodes)
        finish_deployment_modification(modification)
        rollback_deployment_modification(modification)
        send_workflow_event(event_type, message=None, args=None, additional_context=None)
        get_send_node_event_task(workflow_node_instance, event, additional_context=None)

class cloudify.workflows.workflow_context.SystemWideWfRemoteContextHandler(workflow_ctx)
    Bases: cloudify.workflows.workflow_context.RemoteContextHandler

        get_context_logging_handler()
        send_workflow_event(event_type, message=None, args=None, additional_context=None)

class cloudify.workflows.workflow_context.LocalCloudifyWorkflowContextHandler(workflow_ctx,
                                                                                 storage)
    Bases: cloudify.workflows.workflow_context.CloudifyWorkflowContextHandler

        get_context_logging_handler()
        get_node_logging_handler(workflow_node_instance)
        bootstrap_context
        get_send_task_event_func(task)
        get_update_execution_status_task(new_status)
        get_send_node_event_task(workflow_node_instance, event, additional_context=None)
        get_send_workflow_event_task(event, event_type, args, additional_context=None)
        get_task(workflow_task, queue=None, target=None)
        operation_cloudify_context
        get_set_state_task(workflow_node_instance, state)
        get_get_state_task(workflow_node_instance)
        send_workflow_event(event_type, message=None, args=None, additional_context=None)
        download_blueprint_resource(resource_path, target_path=None)
```

```
class cloudify.workflows.workflow_context.Modification(workflow_ctx, modification)
Bases: object

added
    Returns Added and related nodes
    Return type ModificationNodes

removed
    Returns Removed and related nodes
    Return type ModificationNodes

id
finish()
    Finish deployment modification process

rollback()
    Rollback deployment modification process

class cloudify.workflows.workflow_context.ModificationNodes(modification,
                                                               raw_nodes,
                                                               raw_node_instances)
Bases: cloudify.workflows.workflow_context.WorkflowNodesAndInstancesContainer

class cloudify.workflows.workflow_context.WorkflowDeploymentContext(cloudify_context,
                                                                    work-
                                                                    flow_ctx)
Bases: cloudify.context.DeploymentContext

start_modification(nodes)
    Start deployment modification process

    Parameters nodes – Modified nodes specification
    Returns Workflow modification wrapper
    Return type Modification

cloudify.workflows.workflow_context.task_config(fn=None, **arguments)
```
